The user window in Photoshop is simple. It just shows the overall document/image, navigation bars to control the document or image, a tool palette for editing the content, and a status bar for showing a progress message. The first thing you should do after starting Photoshop is to open a new image. But what happens when you open a new image? The image you work on is organized in one of several layers called groups, which named for example Background Layer, Content Layers, or Selection. Each layer is a display device for an interactive document. By default, the layer is inactive because it displays the background of your document. The group is selected so that you can see your document and perform editing tasks. You can arrange your layers in the layers panel to enable working on different elements. You can rearrange layers to see them in a different order. You can make them inactive or visible. You can apply several effects to them, and transform them. You can merge them together and change their size. When you open an image, there are several layers which work like media devices. These are the layers of your image and they are named according to content or type. While most of the layers work in a similar way to Windows Explorer, some work in a different way. Elements work on parts of an image, called content. For example, content layers show basic shapes and colors. Content layers don’t have effects applied to them. They are used as a base layer to work on and as an initial layer for your work.
